Subarray Odd Sum

Time Limit: 1 second **Memory Limit:** 256 MB

Description

You are given an array *A* consisting of *N* integers and an integer *S*.

Your task is to find the maximum length of a contiguous subarray such that the sum of all odd numbers within that subarray does not exceed *S*.

Note that even numbers within the subarray do not contribute to the odd sum constraint, but they are included in the length of the subarray. If a subarray has a sum of odd elements greater than S, it is considered invalid.

Input Format

- The first line contains two integers *N* and *S* ($1 \le N \le 2 \cdot 10^5$, $0 \le S \le 10^{14}$) — the number of elements in the array and the maximum allowed sum of odd elements.
- The second line contains *N* integers $A_1, A_2, \ldots, A_N$ ($1 \le A_i \le 10^9$).

Output Format

Print a single integer representing the maximum length of a contiguous subarray whose sum of odd elements is less than or equal to S.

If there is no valid subarray, print 0.

Samples

Sample 1

Input:

```
5 10
2 5 3 4 1
```

Output:

```
5
```

Explanation: Consider the entire array `[2, 5, 3, 4, 1]`.

- The odd elements are 5, 3, and 1.
- Their sum is 5 + 3 + 1 = 9.
- Since 9 ≤ 10, the entire array is valid, and its length is 5.

Sample 2

Input:

```
3 5
7 9 11
```

Output:

```
0
```

Explanation: Every element is odd and strictly greater than S = 5 (7 > 5, 9 > 5, 11 > 5).

- Any non-empty subarray contains at least one of these elements, so its odd sum is at least 7, which exceeds 5.
- Hence no non-empty subarray is valid, and the answer is 0.
